

# The K-321-301 Study

## A clinical study for patients with Fuchs Endothelial Corneal Dystrophy

As someone living with Fuchs Endothelial Corneal Dystrophy (FECD), you may be interested in learning about the **K-321-301 Study**, a clinical trial investigating a new therapy designed to help treat FECD.

### What is the purpose of the study?

Researchers are looking for better ways to correct visual difficulties of patients living with FECD. Current treatments for FECD include a procedure known as Descemet Stripping Only (DSO), during which the damaged tissue is stripped away. Once the diseased area is removed from the cornea, the patient's own healthy cells move from the outer edges of the cornea to the center. A new investigational medicine called ripasudil (K-321) may help speed up healing and recovery of vision after DSO compared to DSO alone.

### What happens during the study?

This study lasts about a year and has four parts: screening, DSO, treatment, and follow-up. There are 15 study visits in total.

### What is the treatment?

The drug being studied is ripasudil ophthalmic solution 0.4% (K-321). It is administered as an eye drop. In several studies, K-321 has been found to help wounds heal faster and improve vision in FECD patients undergoing DSO alone.

Patients will be randomly assigned to one of these treatment groups:

**K-321** – 4 times daily

**Placebo** (no active ingredient) – 4 times daily

Neither you nor the study doctor will know which study drug you are using. If you would like to learn more about the K-321-301 Study, please contact:
